atmosphere in the step of filling any of the heat-resistant filler and the heat-resistant antifriction material in the state of the aqueous solution into the gaps of the metallic reinforcing member in the foregoing fabricating method. In this way, it is surely possible to prevent bubbles from remaining inside the heat-resistant filler, whereby strength of the gasket basic substance can be enhanced. --

Please replace paragraph [0029] beginning on page 9, with the following rewritten paragraph:

A2

--[0029] Instead of the above-described Step S3, as a reduced pressure immersion a low-pressure immersion process of the heat-resistant filler may be performed in Step S4. This low-pressure immersion process is conducted in accordance with the following processes of: putting the reinforcing member 4, which is the preliminarily molded part of the simple wire fabric, and the aqueous solution of the heat-resistant filler separately into a decompression chamber preferably at 10 Torr or less for deaerating physically-adsorbed gas and dissolved gas, respectively; immersing the preliminarily molded wire fabric for about 5 minutes into the aqueous solution of the heat-resistant filler rendered flowable by agitation in the decompression chamber at a decompression value similar to the foregoing in order to fill the aqueous solution of the heat-resistant filler into the gaps of the reinforcing member 4 made of the preliminarily molded wire fabric; and pulling out

in Step S12. This low-pressure immersion process is conducted in accordance with the following processes of: putting the reinforcing member 4, which is the preliminarily molded part of the simple wire fabric, and the aqueous solution of the heat-resistant antifriction material separately into a decompression chamber preferably at 10 Torr or less for deaerating physically-adsorbed gas and dissolved gas, respectively; immersing the preliminarily molded wire fabric for about 5 minutes into the aqueous solution of the heat-resistant antifriction material rendered flowable by still standing in the decompression chamber at a decompression value similar to the foregoing in order to fill the aqueous solution of the heat-resistant antifriction material into the gaps of the reinforcing member 4 made of the preliminarily molded wire fabric; and pulling out the reinforcing member 4 after the heat-resistant antifriction material is solidified inside and around the reinforcing member 4 according to the dilatancy phenomenon by agitating the heat-resistant antifriction material vigorously. --

Please replace paragraph [0058] beginning on page 19, with the following rewritten paragraph:

A5

--[0058] Furthermore, according to the fabricating method of this embodiment, if the reinforcing member 4 and the aqueous solution of the heat-resistant antifriction material 11
